## 1.1 TIME[ $f(n)$ ]

Informally: problems that can be solved in  $f(n)$  time.

**Definition 1.1.** Given some function  $f : \mathbb{N} \rightarrow \mathbb{N}$ , TIME[ $f(n)$ ] are the set of problems solvable within  $O(f(n))$  atomic steps on a deterministic Turing machine. Where  $n$  is the size of the input.

## 1.2 NTIME[ $f(n)$ ]

Informally: problems that can be solved nondeterministically in  $f(n)$  time.

**Definition 1.2.** Given some function  $f : \mathbb{N} \rightarrow \mathbb{N}$ , NTIME[ $f(n)$ ] are the set of problems solvable within  $O(f(n))$  atomic steps on a nondeterministic Turing machine.

## 1.3 SPACE[ $f(n)$ ]

Informally: problems that can be solved in  $f(n)$  space.

**Definition 1.3.** Given some function  $f : \mathbb{N} \rightarrow \mathbb{N}$ , SPACE[ $f(n)$ ] are the set of problems solvable using a tape of length  $O(f(n))$  on a deterministic Turing machine. Where  $n$  is the size of the input.

## 1.4 NSPACE[ $f(n)$ ]

Informally: problems that can be solved non-deterministically in  $f(n)$  space.

**Definition 1.4.** Given some function  $f : \mathbb{N} \rightarrow \mathbb{N}$ , NSPACE[ $f(n)$ ] are the set of problems solvable using a tape of length  $O(f(n))$  on a non-deterministic Turing machine. Where  $n$  is the size of the input.

## 1.5 P

Informally: all problems that can be solved in polynomial time.

**Definition 1.5.**

$$\mathbf{P} = \bigcup_{k \geq 0} \text{TIME}[n^k]$$

Descriptive Complexity definitions:

**Definition 1.6.**

$$\mathbf{P} = \text{FO(LFP)}$$

(First Order logic extended with the Least Fixed Point operator, with successor. A high level, handwavy description of the LFP operator is the added ability to recursively define FO formulas.)

**Definition 1.7.**

$$\mathbf{P} = \text{SO}(\text{Horn})$$

(Second Order logic restricted with Horn. SO logic allows you to quantify over subsets/relations/functions on the domain, and Horn means all ‘clauses’ are really implications with literal in the conclusion and all literals positive.)

Circuit Complexity definition:

**Definition 1.8.**

$\mathbf{P}$  = Set of problems that can be solved by a polynomial-time uniform family of boolean circuits

Notable Problems in  $\mathbf{P}$ :

- 2-SAT
- 2-Colourability
- Reachability

## 1.6 NP

Informally: all problems that can be solved in nondeterministic polynomial time.

**Definition 1.9.**

$$\mathbf{NP} = \bigcup_{k \geq 0} \text{NTIME}[n^k]$$

Turing Machine definition:

**Definition 1.10.**

$$x \in \mathbf{NP} \iff \exists w : \|w\| \leq p(\|x\|) \text{ s.t. } M(x, w) = 1$$

In terms of a verifier:

Informally: The set of decision problems where a solution can be verified in polynomial time.

Descriptive Complexity Definition:

**Definition 1.11.**

$$\mathbf{NP} = \text{SO}\exists$$

(Existential Second Order)

Notable Problems in **NP**:

- SAT
- 3-Colourability
- TSP
- Subset sum

## 1.7 coNP

Turing Machine definition:

**Definition 1.12.**

$$x \in \mathbf{coNP} \iff \forall w : \|w\| \leq p(\|x\|) \text{ s.t. } M(x, w) = 1$$

In terms of a verifier:

Informally: The set of decision problems where a solution can be refuted in polynomial time.

## 1.8 FPT

Informally, the set of problems that can be solved in polynomial time for some fixed parameter.

**Definition 1.13.** The set of problems that can be parameterised by  $k$  and can be solved in  $f(k)n^c$ , where  $f(x)$  is only dependent on  $k$ , and  $c$  is an independent constant.

**P** is contained within **FPT**.

If a problem is in **FPT**, then for any fixed  $k$  that problem is in **P**.

**FPT** is also known as **W[0]**

Notable Problems in **FPT**:

- Vertex Cover

## 1.9 W[1]

**Definition 1.14.** The class of parametrized problems that admit a parametrized reduction to the following problem: Given a nondeterministic single-tape Turing machine, decide if it accepts within  $k$  steps.

N.B This is short acceptance

**Definition 1.15.** The class of parametrized problems that admit a parametrized reduction to the following problem: Given a Boolean circuit  $C$ , with a mixture of fanin-2 and unbounded-fanin gates. There is at most 1 unbounded-fanin gate along any path to the root, and the total depth (fanin-2 and unbounded-fanin) is constant. Does  $C$  have a satisfying assignment of Hamming weight  $k$ ?

N.B This is Weighted 3-SAT.

Notable Problems in  $\mathbf{W}[1]$ :

- Short Acceptance
- Weighted 3-SAT
- Clique (of size  $k$ )
- Independent set (of size  $k$ )

**1.10  $\mathbf{W}[2]$**

**1.11  $\mathbf{W}[i]$**

**1.12  $\mathbf{FPTAS}$**

**1.13  $\mathbf{PTAS}$**

**1.14  $\mathbf{L}$**

Informally: all problems that can be solved using logarithmic space (excluding the input)

**Definition 1.16.**

$$\mathbf{L} = \text{SPACE}[\log n]$$

This means you effectively have the input and then a fixed number of counters/pointers (up to the size of the input)

Notable Problems in  $\mathbf{L}$ :

- Planar Graph Isomorphism

**1.15  $\mathbf{NL}$**

Informally: all problems that can be solved using nondeterministic logarithmic space (excluding the input)

**Definition 1.17.**

$$\mathbf{NL} = \text{NSPACE}[\log n]$$

This means you effectively have the input and then a fixed number of counters/pointers (up to the size of the input)

**Definition 1.18.**

$$\mathbf{NL} = \text{SO}(\text{Krom})$$

**Definition 1.19.**

$$\mathbf{NL} = \mathbf{coNL}$$

Notable Problems in  $\mathbf{NL}$ :

- Reachability
- Unreachability

## 1.16 PSPACE

### 1.17 $\Sigma_2^P$

**Definition 1.20.**

$$\Sigma_2^P = \mathbf{NP}^{\mathbf{NP}}$$

Turing Machine definition:

**Definition 1.21.**

$$x \in \Sigma_2^P \iff \exists w : \|w\| \leq p(\|x\|) \forall u : \|u\| \leq p(\|x\|) \text{s.t. } M(x, w, u) = 1$$

### 1.18 $\Sigma_i^P$

**Definition 1.22.**

$$\Sigma_i^P = \mathbf{NP}^{\Sigma_{i-1}^P}$$

Turing Machine definition:

**Definition 1.23.**

$$x \in \Sigma_i^P \iff \exists u_1 \forall u_2 \dots Q_i u_i M(x, u_1, \dots, u_i) = 1$$

$|u_j| \leq p(x)$  and  $Q_i = \forall/\exists$  if  $i$  is even/odd.

**Definition 1.24.**

$$\Sigma_i^p = co - \Pi_i^p$$

**1.19**  $\Pi_2^p$

**Definition 1.25.**

$$\Pi_2^P = \mathbf{coNP}^{\mathbf{NP}}$$

Turing Machine definition:

**Definition 1.26.**

$$x \in \Pi_2^P \iff \forall w : \|w\| \leq p(\|x\|) \exists u : \|u\| \leq p(\|x\|) \text{s.t. } M(x, w, u) = 1$$

**1.20**  $\Pi_i^p$

**Definition 1.27.**

$$\Pi_i^P = \mathbf{coNP}^{\Sigma_{i-1}^P}$$

Turing Machine definition:

**Definition 1.28.**

$$x \in \Pi_i^P \iff \forall u_1 \exists u_2 \dots Q_i u_i M(x, u_1, \dots, u_i) = 1$$

$|u_j| \leq p(x)$  and  $Q_i = \exists/\forall$  if  $i$  is even/odd.

**Definition 1.29.**

$$\Pi_i^p = co - \Sigma_i^p$$

**1.21**  $\mathbf{PH}$

**Definition 1.30.**

$$\mathbf{PH} = \bigcup_i \Sigma_i^p$$

**1.22**  $P^{\text{SAT}}$

**1.23**  $\mathbf{NP}^{\text{SAT}}$

$\mathbf{NP}$  with a SAT oracle, equivalent to  $\Sigma_2^p$

## 1.24 TFNP

Conventional complexity classes are concerned with decision problems, i.e., given a graph  $G$  and some number  $k$  determine whether or not  $G$  has a clique of size  $k$ .

This loses its meaning when the answer is always ‘yes’ - for example, does this bimatrix game have a mixed Nash equilibrium?

**Definition 1.31.** TFNP is the set of binary relations  $R(x, y)$  such that for every  $x$  there exists at least one  $y$  (which is at most polynomially larger than  $x$ ) such that  $R(x, y)$  holds. Algorithms that solve problems in this class take an input  $x$  and produce some  $y$  such that  $R(x, y)$  holds, in polynomial time.

## 1.25 PPAD

An example of a problem in TFNP is the following:

**Problem 1.1.** END OF THE LINE. We are given a graph  $G$  that is a disjoint union of directed paths - every vertex has at most one predecessor and at most one successor. This graph may be exponentially sized, but is given implicitly as a Turing machine computing the predecessor and successor of each node (if they exist, otherwise signals that this node is a sink/source).

Given a source in  $G$ , can we find a sink, or any other source, in polynomial time?

Of course, a sink always exists, but simply moving along successor edges may visit all (exponentially many) nodes of a graph.

**Definition 1.32.** PPAD is the set of problems in TFNP reducible to END OF THE LINE.

A notable problem in PPAD, which turns out to be PPAD-complete, is to compute a mixed Nash equilibrium of some bimatrix game.
